Practical 8

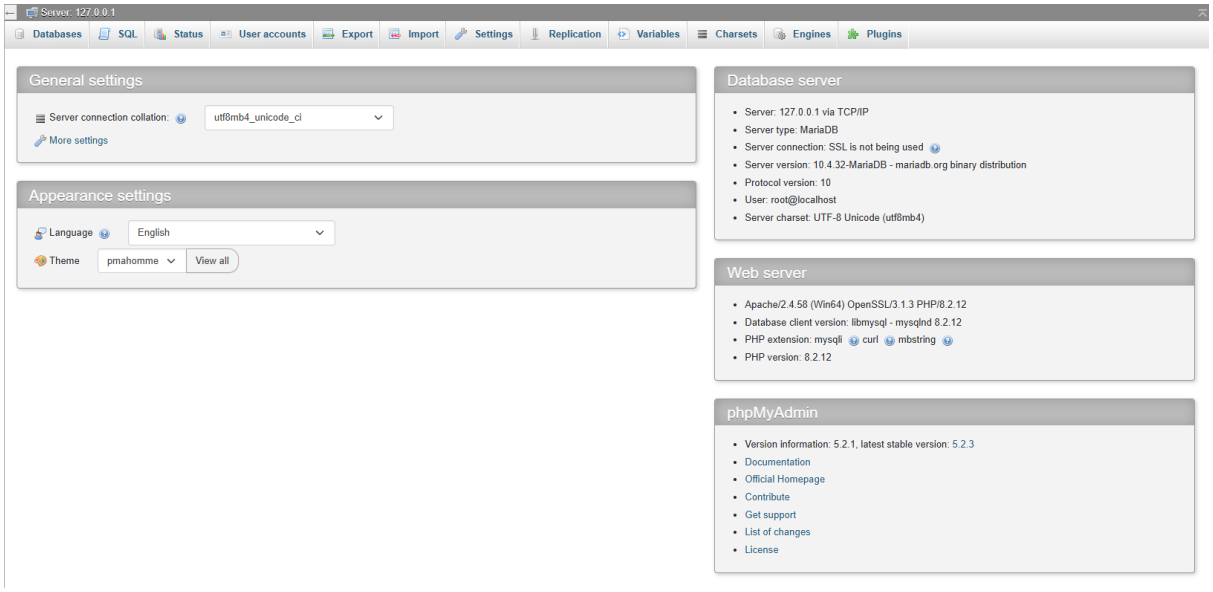

Aim: - Design the database for Student Hub with students, events and registrations. Create PHP database connection using MYSQL statements.

Theory: -

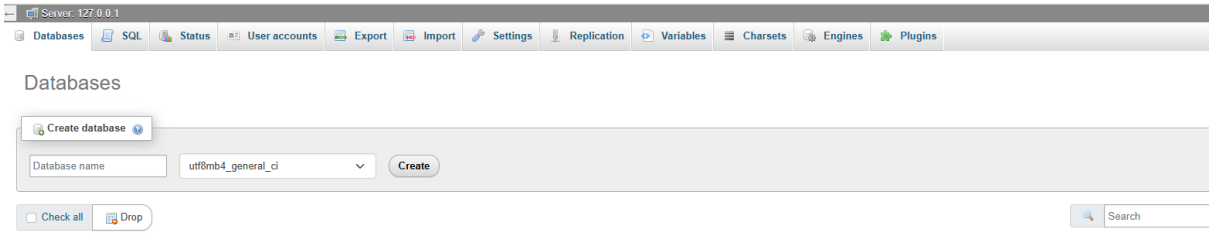

Step 1: -At First, we start Apache and SQL in xampp and click on admin od SQL and create database.

Database Creation: -

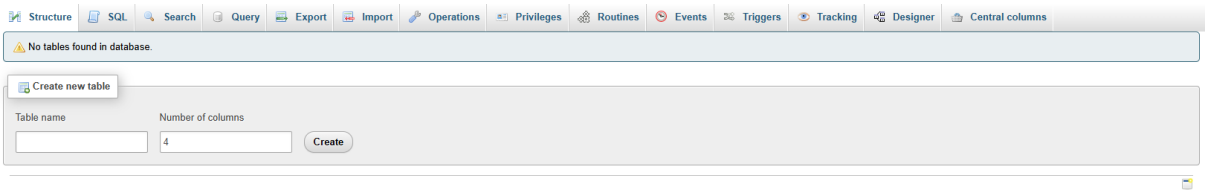

Step 1: - click on database on the left side of screen

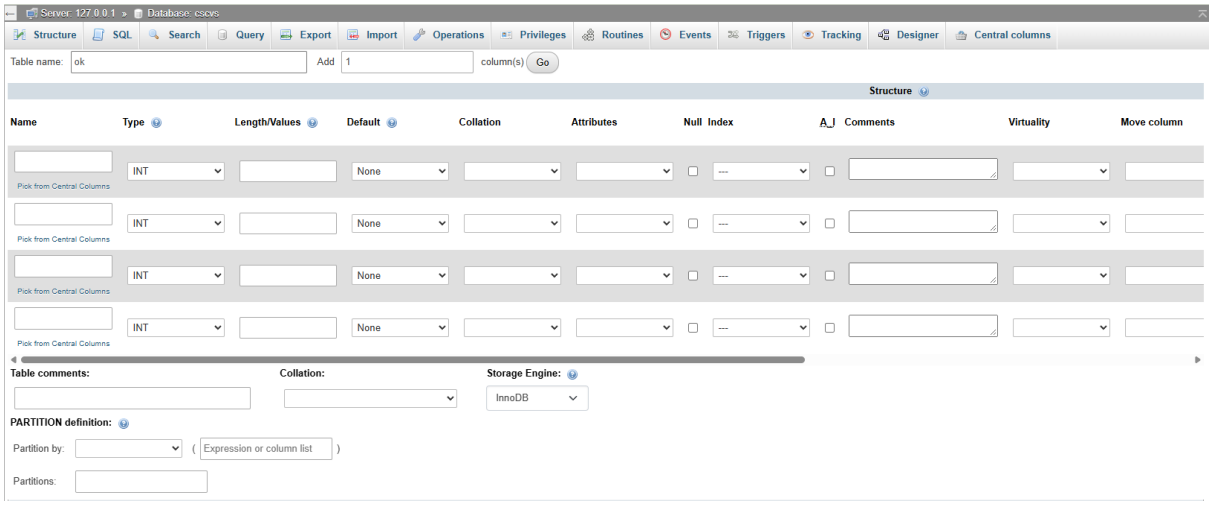

Step 2: - Then give database name by clicking on database name and click on create

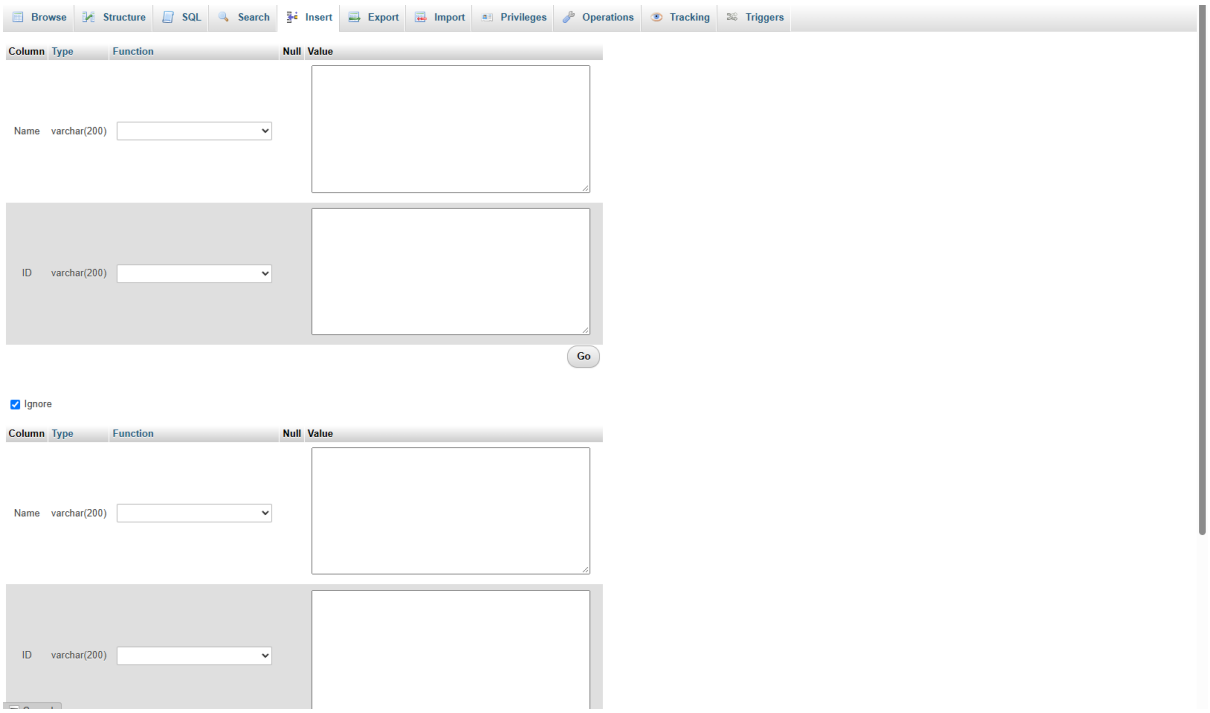

Step 3: - After that give table name and select how many collum do you want

Step 4: -After that give collum name and select type and select hoe many character do you need and then click on save.

Step 5: -After that click on insert and fill the collum.

And that's how your database table created.

Name	ID
Deep	086
Rishit	089
Jay	091
Vatsal	083

Step 2: - Now, create a folder in xampp and give name pr8 and open it in vs code. We have two php files which connect database which we created previous.

file1.php:

file1.php

```php
<?php
$host = "localhost";
$user = "root";
$password = "";
$database = "college";

$con = new mysqli($host, $user, $password, $database);

if ($con->connect_error) {
    die("Connection failed: " . $con->connect_error);
}

echo "Connected successfully";
echo "<br>";

$result = $con->query("SHOW TABLES");

if ($result) {
    while ($row = $result->fetch_array()) {
        echo $row[0] . "<br>";
    }
}

$con->close();
?>
```

Output:

Connected successfully
students

file3.php:

file3.php

```php

<?php
$host = "localhost";
$user = "root";
$password = null;
$database = "College";

try {
    $conn = new PDO("mysql:host=$host;dbname=$database", $user, $password);

    $conn->setAttribute(PDO::ATTR_ERRMODE, PDO::ERRMODE_EXCEPTION);

    echo "Connection successful";
    echo "<br>";

    $result = $conn->query("SHOW TABLES");
    $table = $result->fetchAll(PDO::FETCH_COLUMN);

    print_r($table);

} catch (PDOException $e) {
    echo "Connection failed: " . $e->getMessage();
}
?>

```

Output:

```
Connection successful
Array ( [0] => students )
```
